

Updating the WHMCS Module

Introduction

The SSL Store™ is always working on expanding our WHMCS module with new features and bug fixes. It's important to stay up-to-date so that you, and your end-users, have the best experience. If you are still working on getting the module installed, no worries, please reference our installation article, which will guide you through getting the module all installed.

Setting up for the Update

1. Prior to updating The SSL Store™ Module, you will need to disable the currently installed module.
2. To disable The SSL Store™ Module, proceed to "Setup -> Addon Modules" and at the bottom, click the "Deactivate" button by "The SSL Store™ Module".
3. Please unzip the download and the contents so you have the "modules" folder unzipped.
4. Now that you've successfully extracted the download, you will want to connect via FTP to your server.

Uploading the Module

Note: Uncertain which FTP Client to use? The SSL Store™ recommends FileZilla due to compatibility across all operating systems.

1. Once connected, proceed to the directory housing your WHMCS Installation.
2. Within the directory listing, locate the "modules" folder and click into the folder so you see a list of folders, look for the "addons" and "servers" folders.
3. First proceed into the "addons" folder and copy the folder "thesslstorefullv2_admin" from the downloaded package so the files begin to upload.
 1. You will get a notice informing you that you will be overwriting the files, click "Continue and do not ask again."
4. Upon completion of the uploads, proceed back to the "modules" directory and then into the "servers" directory.
5. Drag the folder "thesslstorefullv2" over so that the files begin uploading.
 1. You will get a notice informing you that you will be overwriting the files, click "Continue and do not ask again."

6. Upon completion of the uploads, proceed back to the “root” directory of your WHMCS Installation and then into the “assets” directory.
7. Drag the folder “ssl_resources” over so that the files begin uploading.
 1. You will get a notice informing you that you will be overwriting the files, click “Continue and do not ask again.”
8. After completion of the upload, proceed to your WHMCS Admin Login page.

WHMCS Configuration

Note: The typical URL path for the Administrator interface is “/admin/”, but this could have been changed. Please ensure that you go to the proper URL as configured.

1. At this point, you should proceed to log in to your WHMCS System using a login that has the role of “Full Administrator” so you can properly configure the module.
2. Once logged in, proceed to the “Setup -> Addon Modules” page so you can continue to set up the module.
3. At the bottom of that page, there will be an option of “The SSL Store™ Module” with the options of “Activate”, “Deactivate” and “Configure,” with the last two being disabled.

» TheSSLStore Module	3.7.2	thesslstore.com	Activate	Deactivate	Configure
TheSSLStore.com Full Plugin for selling SSL within WHMCS					

4. Click the “Activate” button, which will begin the installation of the module.
5. Upon receiving the confirmation “Addon Module Activated,” scroll to the bottom once more and click the “Configure” button.
6. Clicking the “Configure” button will display a permissions menu for your WHMCS System. Proceed with selecting which groups you would like to be able to access The SSL Store™ Module and click “Save Changes.”
7. At this point, you are now officially up to date and ready to keep selling SSL Certificates!
